Is that the problem? Issue on Kaggle: Can't upload Notebook when I try to upload a notebook, when I try to run the notebook. Yes, I already have the Jupyter Notebook module installed: And I also checked it using Jupyter Notebook's help command: Jupyter Notebook's help I also have Python 3.7.2 installed and Python packages with jupyter-lab: Can anybody please help me to figure out what the problem is? A: If you are using Anaconda, make sure you install Python (3.7.2) as well. I had a similar problem and I found it out by changing the "Package Location" in the Import Options. Q: How can I keep my C++ program from freezing when writing to a file? When I open a file in a new C++ application I write to it with this code: FILE* fd; fd = fopen("test.dat", "wb+"); if (!fd) { throw Exception("Error opening file"); } And when I close the file I do it like this: fclose(fd); This works fine when I run my program in Visual Studio, but when I run the program on the actual Linux computer it freezes. It doesn't generate any error messages but it doesn't write anything to the file either. I checked that fd is initialized to a valid pointer, and it is, since I can successfully open the file again. But it doesn't really matter since it's not able to write to the file in the first place. Is there a way to fix this so it doesn't freeze? Edit: After debugging my code I noticed that the debugger seems to stop before opening the file. If you're using Visual Studio, start from the start (Debug -> Start Debugging). If you're on Linux, I'm sure you'll have more luck by starting with a "simple" program that doesn't depend on the file system. If that doesn't work, give us some information about your computer and what you're trying to accomplish. Automatically reassign a project to a developer based on commit history I have a git project that I have been managing myself, but I 82157476af
